"In the plots above, the training accuracy is increasing linearly over time, whereas validation accuracy stalls around 60% in the training process. Also, the difference in accuracy between training and validation accuracy is noticeable—a sign of overfitting. $\n"$ ,  $\n"$ ,

"When there are a small number of training examples, the model sometimes learns from noises or unwanted details from training examples—to an extent that it negatively impacts the performance of the model on new examples. This phenomenon is known as overfitting. It means that the model will have a difficult time generalizing on a new dataset. $\n"$ ,  $\n"$ ,

```
"There are multiple ways to fight overfitting in the training
process. In this tutorial, you'll use data augmentation and add Dropout
to your model."
